Lab 6

1. Internationalization is making software capable of being adapted to different languages/regions while localization is taking that software and adapt it to the local language/region.

2. They are important because they allow the software to reach a much broader market. This allows it to be much more successful. If we didn't have it, each language or region would have to come up with its own software or go through a long process of translating the software to another language.
